

# Practical

## SUMMARY:-

This practical demonstrated the implementation of Linear Search and Binary Search in C. It helped understand how both algorithms search for an element and compare their efficiency.

**Linear Search** checks each element one by one until the target element is found or the array ends.

## Output

```
number is found
...Program finished with exit code 0
Press ENTER to exit console.
```

## Time Complexity

| Case | Time Complexity |
|------|-----------------|
|------|-----------------|

|           |        |
|-----------|--------|
| Best Case | $O(1)$ |
|-----------|--------|

|              |        |
|--------------|--------|
| Average Case | $O(n)$ |
|--------------|--------|

|            |        |
|------------|--------|
| Worst Case | $O(n)$ |
|------------|--------|

**Binary Search** repeatedly divides a sorted array into two halves to quickly find the target element.

## Output

```
the number is found:40
...Program finished with exit code 0
Press ENTER to exit console.
```

## **Time Complexity**

| <b>Case</b> | <b>Time Complexity</b> |
|-------------|------------------------|
|-------------|------------------------|

|           |        |
|-----------|--------|
| Best Case | $O(1)$ |
|-----------|--------|

|              |             |
|--------------|-------------|
| Average Case | $O(\log n)$ |
|--------------|-------------|

|            |             |
|------------|-------------|
| Worst Case | $O(\log n)$ |
|------------|-------------|

## **Conclusion :**

We learned that Linear Search works on any array but is slower, while Binary Search is faster and more efficient for sorted arrays.
